

EXERCISE - 4

Launching Web Applications using App Engine Tools

Aim:

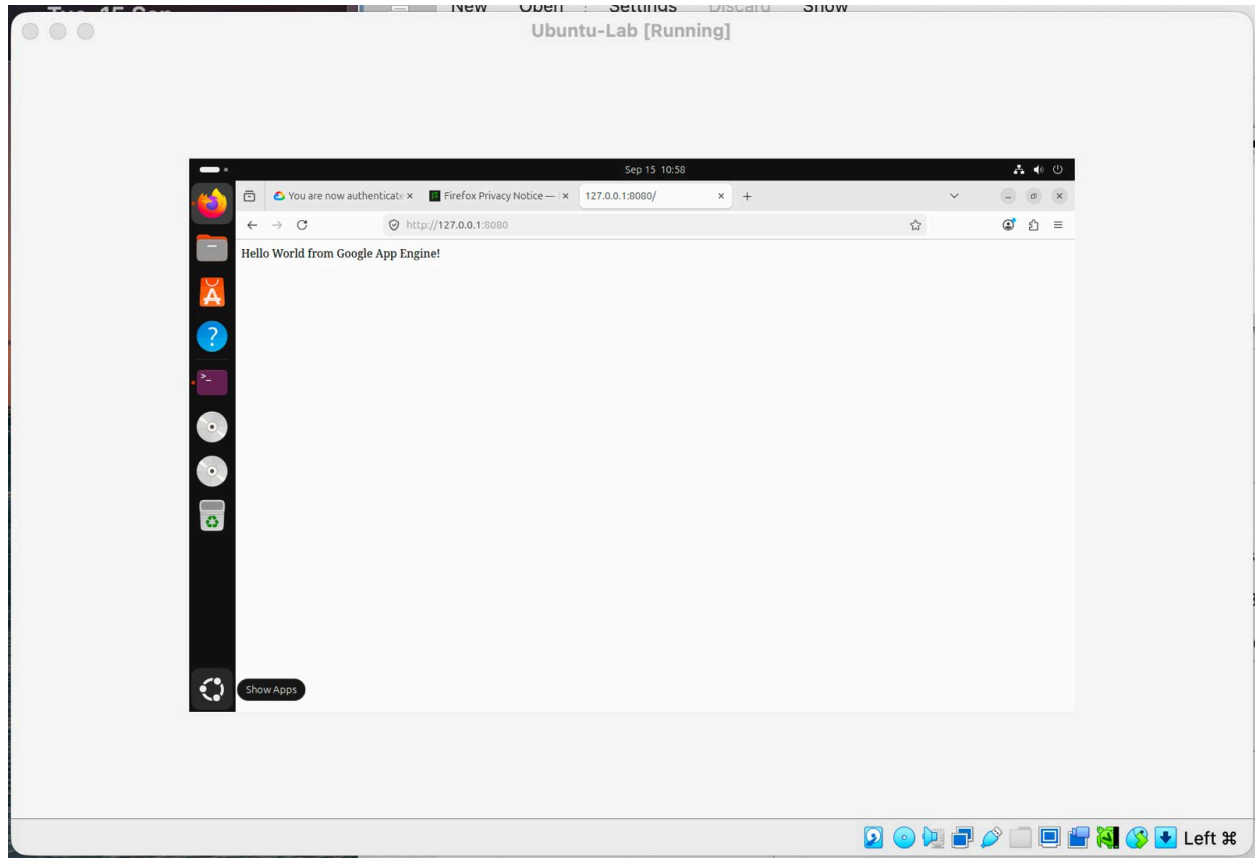

To configure a Python virtual environment, install the required dependencies, and **launch the Flask web application using App Engine tools**.

Algorithm:

1. Start Ubuntu and open the application directory.
2. Update the Ubuntu package information.
3. Install the Python virtual-environment packages.
4. Create a new Python virtual environment.
5. Activate the created virtual environment.
6. Install the application dependencies from the requirements file.
7. Verify the installed Flask and Werkzeug versions.
8. Execute the Python application.
9. Start the Flask development server on the local system.
10. Open the application in a web browser using the local server address.
11. Verify that the “**Hello World from Google App Engine!**” message is displayed successfully.

Output:

127.0.0.1:8080

Result:

Thus, the **Python virtual environment was successfully configured**, the **required Flask dependencies were installed**, and the **web application was launched successfully**, displaying the expected **“Hello World from Google App Engine!”** output in the browser.
